                                                       30-148. TO FORM A MATURE CHAIN THE PRECURSOR UNDERGOES FURTHER POST-TRANSLATIONAL MODIFICATION AFTER REMOVAL OF THE SIGNAL SEQUENCE; CLEAVAGE AFTER ASN AT POSTITIONS 148, 163, AND 281 IS POLLOWED BY TRANSPOSITION AND LIGATION (BY FORMATION OF A NEW PEPTIDE BOND) OF RESIDUES 164-281 AND 30-148.

MISCELLANEOUS; BINDS ONE MANGARESE (OR OTHER TRANSITION METAL) ION AND ONE CALCIUM ION. THE METAL IONS ARE ESSENTIAL FOR THE SACCHARIDE-BINDING AND CELL-AGGLUTINATING ACTIVITIES.

SIMILARITY: BELONGS TO THE LEGUMINOUS LECTIN FAMILY.

Biol. 29:579-598(1995).
-! FUNCTION: MANNOSE/GLUCOSE BINDING BARK LECTIN.
-! FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGGUS INTERTBRATES OR HERBIYOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                              SUBUNIT: HOMOTETRAMER.
MISCELLANEOUS: BINDS ONE MANGANESE (OR OTHER TRANSITION METAL) ION
AND ONE CALCIDM ION. THE METAL IONS ARE ESSENTIAL FOR THE
SACCHARIDE-BINDING AND CELL-AGGLUTINATING ACTIVITIES (BY
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae; eurosids I; Fabales; Fabaceae; Papilionoideae; Sophoreae; Cladrastis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N-LINKED (GLCNAC. .) Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present sequence is derived from a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopolatic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment paint of the patient with a therapeutic treatment reduces the hematopoletic progenitor cell-depleting activity alleviates or reduces the hematopoletic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangiobolasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell
 depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

 This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 97 ORFs are shown. The proteins are variously cell envelope proteins, cytoplasmic proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid so proteins are claimed, as are sequences. The vaccines are useful for treating or reducing the risk of H. Pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. Pylori life cycle or to inhibit H. Pylori infection.

 The invention relates to a peptide (I) encoded by an operon (II) of Neisseria meningitidis including virulence genes, or a related molecule draving a 40% sequence similarity at the peptide or nucleotide level in a Gram-negative bacterium, or its functional fragment, for therapeutic or diagnostic use. (I) and (II) are useful in the manufacture of a macdicament for treating or preventing a condition (e.g., meningitis) associated with infection by Neisseria or Gram-negative bacteria. The product is useful for veterinary treatment and in a screening assay for the identification of an antimicrobial drug. The vaccines have prophlactic applications. ANU72911-AAU73014 represent N. meningitidis virulence proteins of the invention.
 Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
 Gaps

aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant are useful for identifying modulators. The identified modulators are selected.

 The invention relates to identifying target proteins (ABB90790-ABB94016) for herbicidally active compounds, comprising and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant organisms using suitable search parameters, where plant sequences having an E-value greater by a factor of 3 than the E-value of most similar non-plant sequences are selected. The polypeptides or nucleic acids encoding them are useful for identifying modulators. The identified modulators are useful as herbicides.
 Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score.of the result being printed, and is derived by analysis of the total score distribution.

 DOUBLE THOUGOESIN. TO THE PROSPECT OF THE PROSPECT OF THE DOUBLE THOUGH THE PROBALY BINDS TWO OR THREE CALCIUM IONS.

-!- TISSUE SPECIFICITY: EXPRESSED IN NEURONAL TISSUES. HIGH LEVEL EXPRESSION SEEN IN THE CORTICAL REGIONS OF THE CENTRAL BRAIN AND LOWER LEVELS IN THE LAMINA, THE FIRST OFTIC LOBE OF THE BRAIN. IT IS ALSO FOUND IN THE LAMINA, THE REST OFTIC LOBE OF THE BRAIN. IT.
-!- DEVELOPMENTAL STAGE: FOUND IN THE EMBRYOS, LARVAE AND PUPAE. EXPRESSION IN THE ADULT HEADS IS HIGHER THAN IN THE BODIES.
-!- MASS SPECTROMETRY: MW=21975.51; METHOD=Electrospray.
-!- SIMILARITY: TO OTHER REF. HAND CALCIUM BINDING PROTEINS, BELONGS TO THE RECOVERIN SUBFAMILY.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pylartin proteins which preserve progenitor cells - useful for haematopoietic therapies in cancer treatment or for treating haematologic diseases

```
The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.
 The sequence corresponds to the N-terminal region of a human Flk2 receptor protein-tyrosine-kinase ligand, isolated from phytohemagglutinin-stimulated human peripheral blood leukocyte
 human F1k2 receptor protein-tyrosine-kinase ligand; peripheral periperal blood leukocyte conditioned medium; bone marrow disorder diagnosis; hematopoietic stem cell;
 Ligand for receptor protein tyrosine kinase - useful for the
 stimulation of primitive haematopoietic stem cells causing proliferation and/or differentiation

 The present sequence is derived from FRIL (FIRZ/FIL3 tyrosine kinase receptor-interacting lectin), and is used to raise antibodies. The specification describes a composition of one or more members of FRIL family of progenior cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment, including radiotherapeutic candron chematopoietic progenitor of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemandioblasts, and messenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of
 préservation of hematopoletic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
tissue culture conditioned medium. The ligand may be used in diagnosis of bone marrow disorders, and to stimulate the proliferation and/or differentiation of primitive hematopoletic stem cells. The ligand binds to a receptor protein-tyrosine-kinase expressed in primitive but not mature mammalian hematopoietic cells.

The present sequence represents a FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of reducing the hematopoietic progenitor cell-depleting activity of chemotherapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment of the patient with a therapeutic treatment of the patient cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for therapeutic progenitor cells, hemangioblasts, and mesenchymmal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing
chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predalsposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.

receptor-interacting lectin) polypeptide. The specification describes a composition of once members of FRIL family of progenitor cell preservation feactors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or patient prior to treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment thaving a hematopoietic progenitor cell-depleting activity of the treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cells depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics.
 It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
 Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer therapeutics

 The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can cherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for
 e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.

 preservation factor. The protein is used to preserve unipotent, pluripotent or totipotent progenitor cells, especially haematopoletic cells, and also progenitors from nerve, muscle, skin, gut, bone, kidney, liver, pancreas or thymus. Specific applications are preservation of cultured cells intended for administration after (anticancer) myeloablative therapy (bone marrow or whole-body irradiation or chemotherapy) to reconstitute the haematopoletic system; enrichment of progenitor cells (e.g. during ex vivo purging of malignant cells); treatment of tissues containing haematopoletic progenitors for subsequent transplant to improve haematopoletic competence; improving transfer of
 exogenous DNA to progenifor cells (in gene therapy of various haematological disorders, e.g. sickle-cell anaemia); and protection against ablative therapy (to eliminate proliferating cells specifically), followed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLK2/FLT3 receptor.
 Lectin derived progenitor cell preservation factor; progenitor cell; haematcopoidetic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection; PLK2/FLT3 receptor.

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher ewkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16175-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;
 The present sequence represents a Nkd (naked cuticle) polypeptide. In Drosophila, Nkd is a segment-polarity gene whose expression is induced by Wht signalling. The Nkd polypeptide acts to antagonize Mnt signalling. Nkd may link ion fluxes to the regulation of Wnt signal potency, duration or distribution. The Nkd polynucleotides can be used for identifying homologous or related proteins, to modulate the expression or function of Nkd polypeptides, and in studying associated physiological pathways. Nkd polynucleotides can also be used in gene therapy to treat disorders associated with Nkd defects. They may also be used for therapeutic purposes e.g. treatment of cancer.
 An isolated nucleic acid molecule useful for analyzing (genetic predisposition to) a disease state and for therapeutic purposes e.g. treatment of cancer comprises a sequence encoding a naked cuticle

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution. /cgn2\_6/ptodata/1/paa/US101\_COMB.pep:\*/cgn2\_6/ptodata/1/paa/US102\_COMB.pep:\*/cgn2\_6/ptodata/1/paa/US60\_COMB.pep:\*

 MOLECULE TYPE: protein *-DESCRIPTION: Region of rat neural visinin-like protein DESCRIPTION: (Gen2:Ratnvpl) with homology to lily
 GENERAL INFORMATION:
APPLICANT: Bachettira W. Poovaiah, Zhihua Liu,
APPLICANT: Shameckumar Patil, Daisuke Takezawa
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR
TITLE OF INVENTION: PRODUCTION OF MALE-STERILE PLANTS
 MOLECULE TYPE: protein
DESCRIPTION: Region of chicken visinin-like protein
DESCRIPTION: (Gen2:Ggvilip) with homology to lily
DESCRIPTION: CCAMR
 ADDRESSEE: Klarquist Sparkman Campbell Leigh & ADDRESSEE: Whinston, LLP

 "Sequencing and characterization of trypsin modulating oostatic factor (TMOF) from the ovaries of the grey fleshfly, Neobellieria (Sarcophaga) bullata.";
Regul: Pept. 50:61-72(1994).
-!- FUNCTION: HAS AN OOSTATIC ACTIVITY. INHIBITS TRYPSIN BIOSYNTHESIS IN THE MIDGUT WHICH INDIRECTLY REDUCES THE VITELLOGENIN CONCENTRATION IN THE HEMOLYMPH RESULTING IN INHIBITION OF OOCYTE
 Trypsin-modulating oostatic factor (TMOF).
Sarcophaga bullata (Grey flesh fly) (Neobellieria bullata).

New nucleic acid encoding plant lectin that preserves progenitor

```
The present sequence represents a peptide of lectin derived progenitor

a cell preservation factor. The protein is used to preserve unipotent,

pluripotent or totipotent progenitor cells, especially haematopoietic

cells, and also progenitors from nerve, muscle, skin, gut, bone,

kidney, liver, pancreas or thymus. Specific applications are

preservation of cultured cells intended for administration after

carticancer) myeloablative therapy (bone marrow or whole-body irradiation

or chemotherapy) to reconstitute the haematopoietic system; enrichment

cor chemotherapy) to reconstitute the haematopoietic system; enrichment

cor progenitor cells (e.g. during ex vivo purging of malignant cells);

treatment of tissues containing haematopoietic progenitors for subsequent

transplant to improve haematopoietic competence; improving transfer of

transplant to improve haematopoietic competence; improving transfer of

exogenous DNA to progenitor cells (in gene therapy of various

against ablative therapy (to eliminate proliferating cells specifically),

collowed by re-establishment of differentiation and proliferation of

preserved progenitors. The protein, when linked to magnetic beads, may

also be used to to isolate cells that express the FLK2/FLT3 receptor.

reducing the hematopoietic progenitor cell-depleting activity of therapeutic treatment, including radiotherapeutic and/or therapeutic treatment, including radiotherapeutic and/or chematopoietic progenitor cell-depleting activity of a patient prior to treatment of the patient with a therapeutic treatment of the patient with a therapeutic treatment call depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemandioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
 The present sequence is derived from a FRIL (FIK2/FIt3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor preservation factors. The composition is useful for alleviating or

 The present peptide is an antigen derived from human interleukin 9 (hIL-9) receptor, also known as asthma associated factor 1, which can be used to raise antibodies (Ab) that block the binding of hIL-9 to its receptor. hIL-9 plays a role in acopic allergy, asthma and related disorders, e.g. bronchial hyperesponsiveness (BHR), rhinitis, urticaria, allergic inflammatory disorders of the bowel and various forms of eczema. Compounds which down regulate the function of IL-9, e.g. antisenses DNA, Ab, truncated (soluble) it-9 and its splice variants and other IL-9 or IL-9 receptor. Ab are also useful for alleviating such diseases. Anti-IL-9 have also useful for quantifying IL-9 in a sample.
 Human interleukin-9 variant with Met at position 117 - useful for treating atopic allergy, esp. asthma

The CS31A subunit of the E.coli capsular protein can accept large inserts (up to 100 amino acids) without inhibition of biosynthesis. The insertions are esp. epitope sequences from viruses and the modified subunits, or microorganisms expressing them, are useful as immunogens. Pref. the subunit has at least one insertion and/or substitution by a heterologous peptide in one of the regions -13 to +8, 10-58, 123-164 or 183-257. Esp. the modifications are made in the regions corresp. to natural epitopes of CS31A as these are the most accessible sites on the folded protein. The epitopes were identified and localised by assaying antipeptide capture. This peptide was shown to correspond to an accessible region.

 mutagnessed versions of the complementarity determining region 2 (CDR2) of the antibody designated CHA255 light chain. CHA255 is a murine monoclonal antibody (MAD) which is capable of binding complexes.

Mutagenesis of these CDRs, causes the production of polypeptides with a particularly high binding affinity for EDTA or DOTA metal complexes. CDR and "3 of the heavy chain, and CDR2 and "3 of the light chain were targeted for mutagenesis. Five residues of both CDR1 and "3 of the nine light chain CDR3 residues were specifically targeted for codon-based mutagenesis. The mutagenised MAD's can be used in compositions for in vivo imagins of malignant tissues or tumours. They are also useful for the treatment of malignant tissues or tumours eg.
 CDR
 specifically delivered to the target site by a targetting molecule. Cl
derived peptides may be used to construct bi-functional antibodies
having dual specificities, or as donor or recipients of CDR sequences.

 Antiinflammatory; T21/DP107; gp41 ectodomain; HIV-1 fusion; formyl peptide receptor family; FPR; inflammatory response up-regulation; chemoattractant.
 The present sequence is a peptide fragment of T21/DP107. T21/DP107 is helical segment of the ectodomain of HIV-1 protein gp41. T21/DP107 is located in the amino terminus of the gp41 ectodomain. gp41 plays a critical role in the fusion of HIV-1 and host cell membranes. T21/DP107 interacts with members of the formyl peptide receptor (FPR) family and thereby up-regulates an inflammatory response, and acts as a potent chemoattractant and activator of human peripheral blood phagocytes (but not T cells). The present peptide can be used to modulate an inflammatory response in a subject.

Group M, subtype B, isolate LAI. The invention relates to raising a neutralising antibody response to a broad spectrum of HIV-1 and neutralising antibody response to a broad spectrum of HIV-1 (human immunodeficiency virus) strains and isolates, comprising the administration of a peptide which corresponds to or mimics highly conserved portions of gp41 which are important in mediating the process of viral entry into host cells. Such peptides can correspond to or mimic the coiled coil solution structure of the N-helical domain (the heptad repeat region), or can correspond or mimic the C-helical content in amphigathic alpha-helical segment). Or the gp41 core 6-helix bundle, which is formed by the interaction of the N- and C-helical domains of three gp41 proteins. The peptides can be administered either singly or as a combination (particularly a combination of N-helical and C-helical domain peptides can be multimerised. For example, N- and C-helical domain peptides can be alternately linked together to form a peptide which minists the core corresponds. With the production of the peptide (s) generates a humoral response, with the production of antibodies against gp41 structures involved in viral entry of services of part of any viral entry. The period of antibodies against gp41 structures involved in viral entry of services of grant are well conserved.
 propriate the ability of HIV to infect uninfected cells. A composition comprising polyclonal or monoclonal antibodies can be administered to reduce HIV infection of uninfected cells. Antibodies raised against entry-relevant gp41 structures may also be used therapeutically and as tools to further elucidate the mechanism of HIV cell entry.
 such antibodies may be effective against a broad range of HIV strains and isolates. The peptide compositions may be administered as a prophylactic or therapeutic vaccine to generate antibodies which reduce
 Raising neutralizing antibody response to human immunodeficiency virus, comprises administering a polypeptide capable of forming a stable coiled-coil solution structure -

 The present invention describes a modified anti-viral peptide (I) comprising a peptide that exhibits anti-viral activity and a reactive group which is reactive with amino groups, hydroxyl groups, or thiol groups on blood components to form stable covalent bonds. (I) has anti-viral and anti-fusogenic activities. (I) inhibits viral infection of cells by inhibiting cell-cell fusion or free virus infection or to reduce the level of membrane fusion events between two or more entities, that occurs in the absence of the peptide. (I) is useful in the treatment of patients who are suffering from viral infection, e.g. HIV, RSV, HPIV, MeV, and SIV. (I) may be administered prophylactically to priviously uninfected individuals. This is useful in cases where an evilant is useful to the evilant in the evilant in the evilant is useful to the evilant in the evila
 individual has been subjected to a high risk of exposure to a virus. By bonding of long-lived components of the blood, such as immunoglobin, serum albumin, red blood cells and platelets the activity is extended for days to weeks. This is due to improved stability in vivo and a reduced susceptibility to peptidase or protease degradation. This minimises the need for more frequent, or even continual, administration of the peptides. AAB54784 to AAB55431 represent peptides used in the exemplification of the present invention.
 Long lasting fusion peptide inhibitor; viral infection; antiviral; antifusogenic; mobile blood component; measles virus; MeV; SIV; simlan immunodeficiency virus; human parainfluenza virus; HPIV; RSV; human respiratory syncytial virus; human immunodeficiency virus; HIV.
 A modified peptide and a reactive group which is reactive with amino groups, hydroxyl groups, or thiol groups on blood components to form stable covalent bonds useful for treatment of viral infections, e.g.

The invention relates to the expression of epitope peptides from recombinant vectors which contain a recombinant structural gene into which a random ollopouclectide of sequence GATCCTTM(15)AA has been inserted. Sequences X16832-X16845 represent examples of the inserted oligonuclectides. Several of the peptides encoded by the oligonuclectides have been shown to to have similarity to proteins in the Genbank sequence database. This sequence is a fragment of the human fibrinogen gamma A/B chain precursor protein and is example of a homologous peptide sequence. The recombinant peptides are then expressed on the surface of an organism e.g. a bacteriophage, for ease of identification. The invention may be used for the identification and characterisation of peptide epitopes.
 Population of recombinant vectors, oligonucleotides and random peptide sequences - useful for the identification and characterisation of peptide epitopes

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pylartin proteins which preserve progenitor cells - useful for haematopoietic therapies in cancer treatment or for treating haematologic diseases

ö

```
QQ
 0
 ;
 The peptides AAW61497-W61502 can be used to form pylartin proteins which preserve progenitor cells (pc). The proteins can be used for protecting the integrity of the haematopoietic processes in vivo and as adjuncts in therapeutic treatments related to cancer and other diseases which can otherwise adversely impact upon the haematopoietic system. Since the proteins bind specifically to primitive PCs, they can also be used for the identification and localisation of PCs. The methods can be used for
 e.g. expanding PC populations ex vivo to increase chances of engraftation, improving conditions for transporting and storing PCs and for removing a fundamental barrier thereby enabling gene therapy to treat and cure a broad range of life-threatening haematologic diseases such as sickle cell anaemia and thalassemia.

The present sequence is derived from FRIL (FIRZ/FIL3 tyrosine kinase receptor-interacting lectin), and is used to raise antibodies. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment including radiotherapeutic and/or chemcherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment by the patient with a therapeutic treatment by the patient with a cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of
 Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
tissue culture conditioned medium. The ligand may be used in diagnosis of bone marrow disorders, and to stimulate the prolliferation and/or differentiation of primitive hematopoietic stem cells. The ligand binds to a receptor protein tyrosine kinase expressed in primitive but not mature mammalian hematopoietic cells.

AAY45390 to AAY48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA)) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes

```
CC Figure 1, A1, A3.2 or A24.1 or HIA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are cornally induced by an antigen in the form of a peptide fragment bound to a HIA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour respection and in fighthing viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C. AIDS, and renal carcinoma.

They can be administered as vaccines to elicit an immune response in cancer, or used to treat chronic or acute conditions. They are also cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunospento peptides are also useful

 The present invention describes a nucleic acid molecule (I) encoding at least one complementary determining region (CDR) of a variable region of an antibody which specifically interacts with the extracellular domain of the human zeta-chain. The antibody whose CDR of a variable region is encoded by (I), is obtained by immunising a rat with jurkat cells and subsequently with a conjugate comprising a carrier molecule and a peptide having 11 N-terminal amino acids of a rat zeta-chain. The antibody is useful for the treatment and prevention of anti-zeta-chain antibody is useful for the treatment and prevention of autoimmune diseases immune deficiencies, T-cell malignancies, infectious diseases and the suppression of immune response preferably in order to avoid graft rejection after organ transplantation, malignancies, or viral infections. The antibody, and fragments of it, can be useful for the treatment of NK-cell derived malignancies. It can also be useful for the

New cadherin modulating agents, used for modulating nonclassical cadherin-mediated functions for treating e.g. cancers, obesity, rheumatoid arthritis, multiple sclerosis, diabetes or a neurological 

Claim 72; Page 197; 252pp; English.

The present invention describes cadherin modulating agents (MA) comprising peptides which comprise a nonclassical cadherin cell adhesion cereognition (CAR) sequence. The MAs can be used for modulating nonclassical cadherin-mediated functions. They can be used for e.g. inhibiting adhesion of nonclassical-cadherin expressing cells in a mammal, enhancing delivery of a drug through the skin of a mammal, can amamal, treating cancer in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting metastasis of a cancer in a mammal, inhibiting cell, preventing or treating obesity in a monclassical cadhering expressing cell, preventing or treating obesity in a mammal, stimulating blood vessel regression in a mammal, enhancing adhesion of contran nervous system, treating a demyelinating neurological disease, increasing vasopermeability in a mammal, enhancing adhesion of contrant or preventing pregnancy in a mammal, they can also be used for can mammal, or preventing pregnancy in a mammal. They can also be used for treating e.g. psoriasis, c.g. enhancing of increting neurite outgrowth, facilitating wound the mammal. They can also be used for treating e.g. psoriasis, arthritis, age-related macular degeneration, multiple sclerosis and diabetes. The products can also be used for detection and diagnosis and continered in the assemblished of peptides, and Any Asy 1318 for Asy 1218 for present specifically claimed reminered in the present the period of the present specifically claimed reminered in the present the period of the period of the present the period of the present the period of the peri sequences used in the exemplification of the present invention
